

Kite website

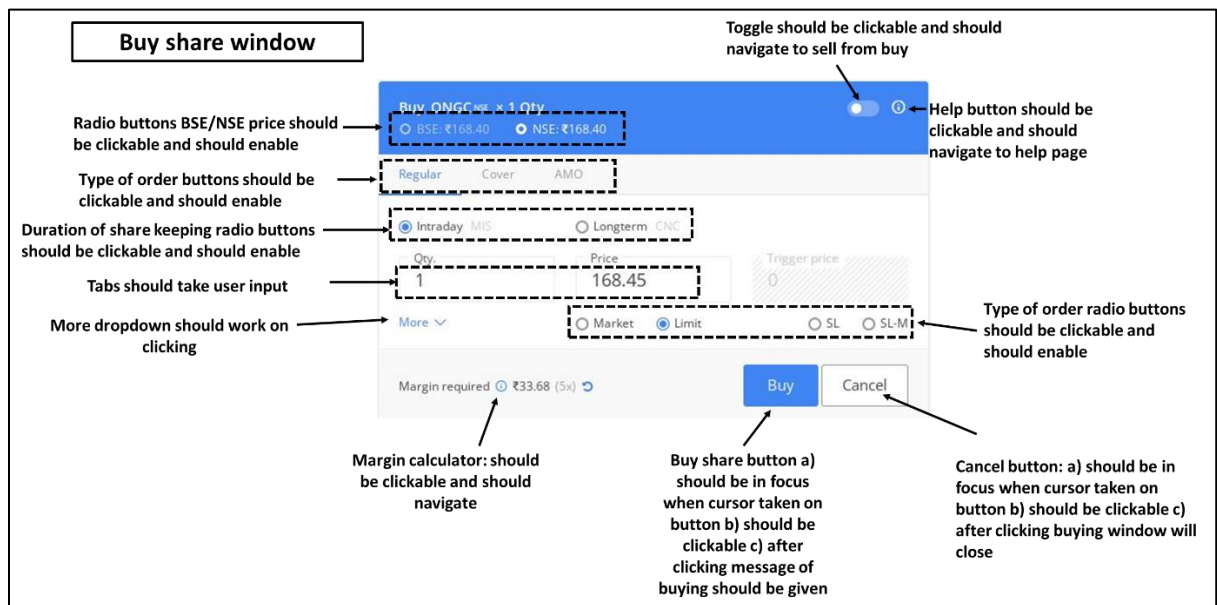

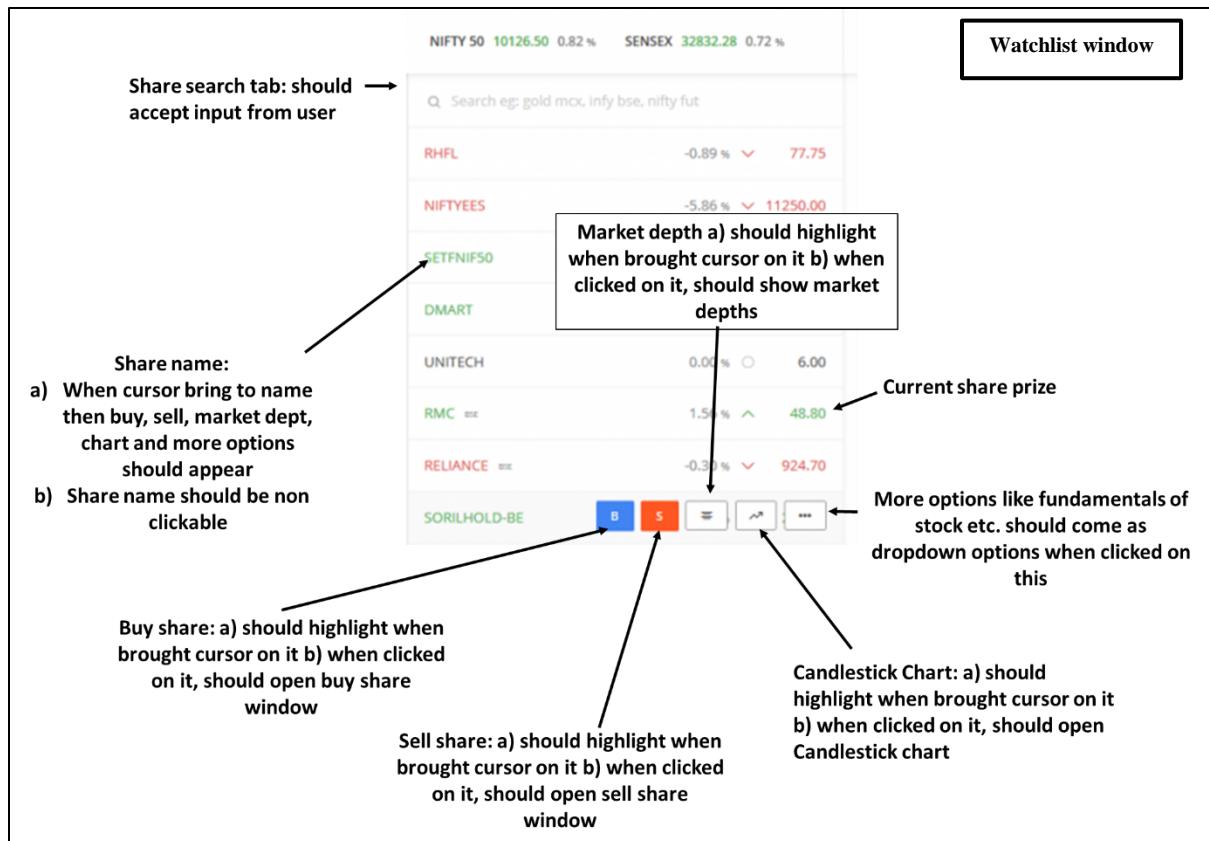

1) Task: How a tester will perform a different functionality testing on kite application?

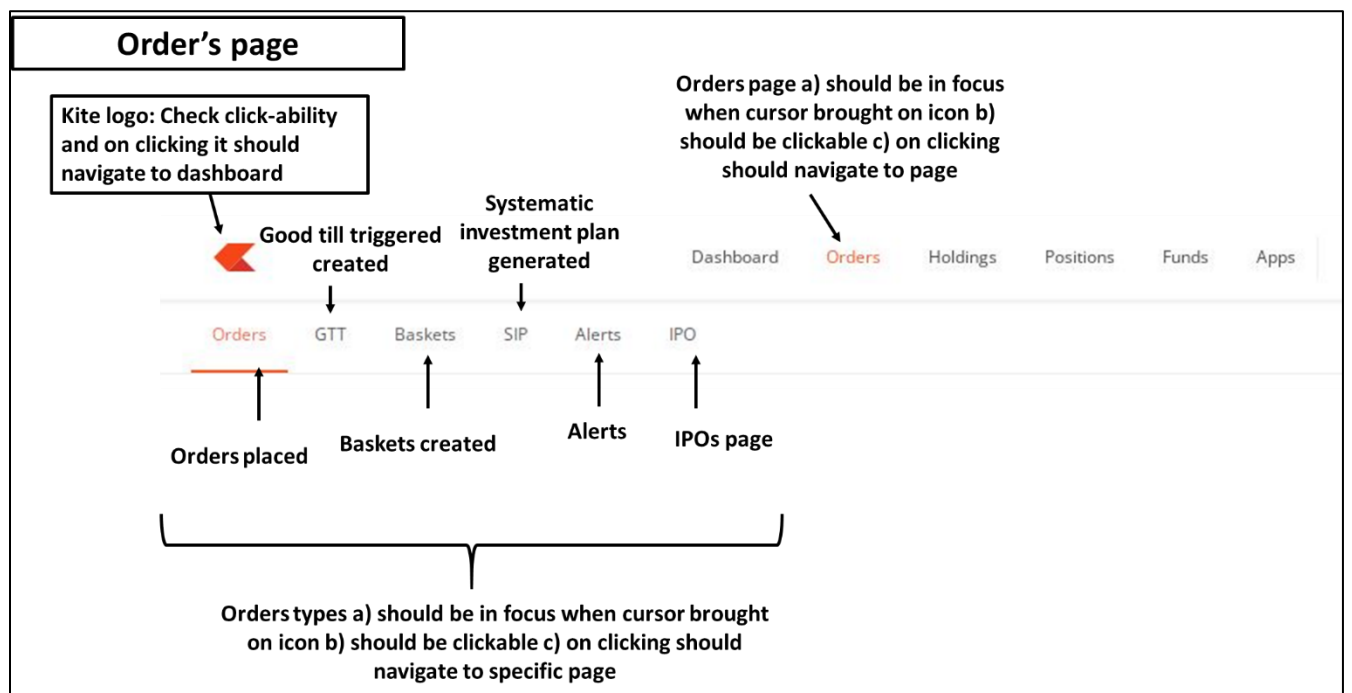

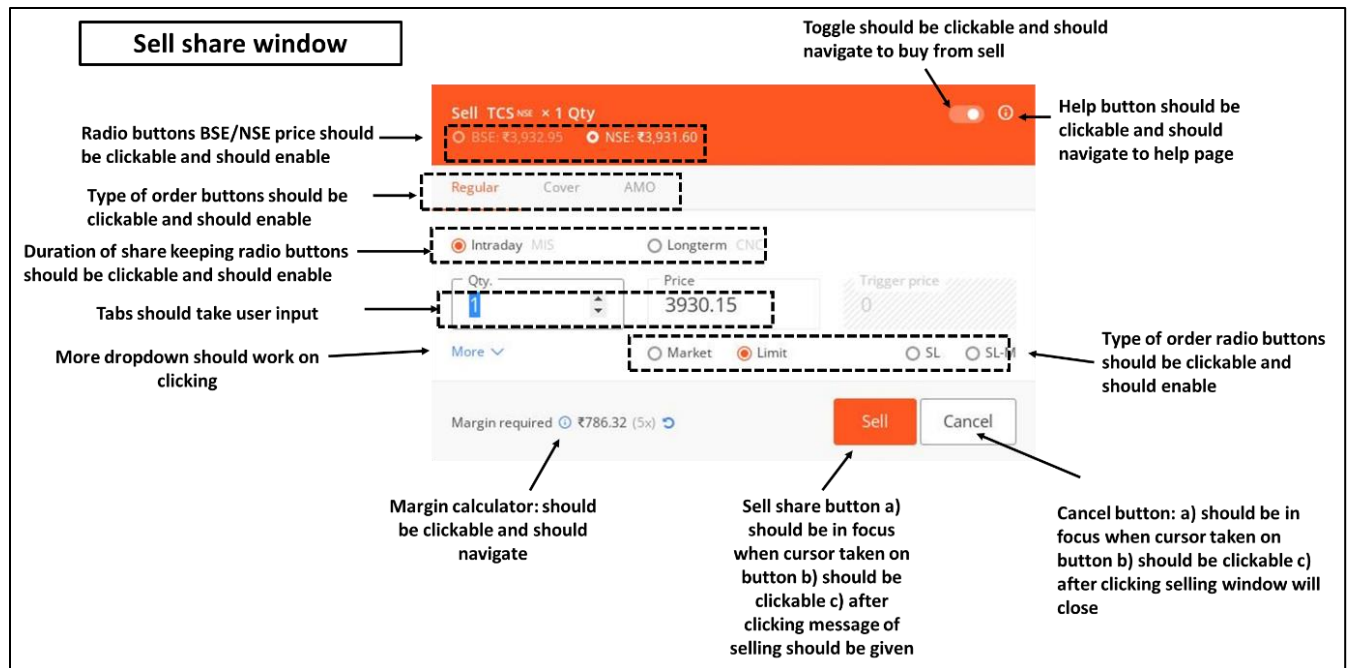

Functionality testing: In this type of testing, tester **validate the internal functionality** (coding) of an application **based on external functionality**/front end. Here we execute our test cases. There are **total 6 types/coverages** in functionality testing: 1) Behavioral coverage 2) Error handling coverage 3) Backend coverage 4) Service level coverage 5) Calculation based coverage 6) Input domain coverage

- 1) **Behavioral coverage:** As a tester we validate the behavior of the objects/web elements in an application. We simply check all the objects like checkbox, radio buttons are working properly according to Stakeholder's requirement or not. Eg. In kite app:

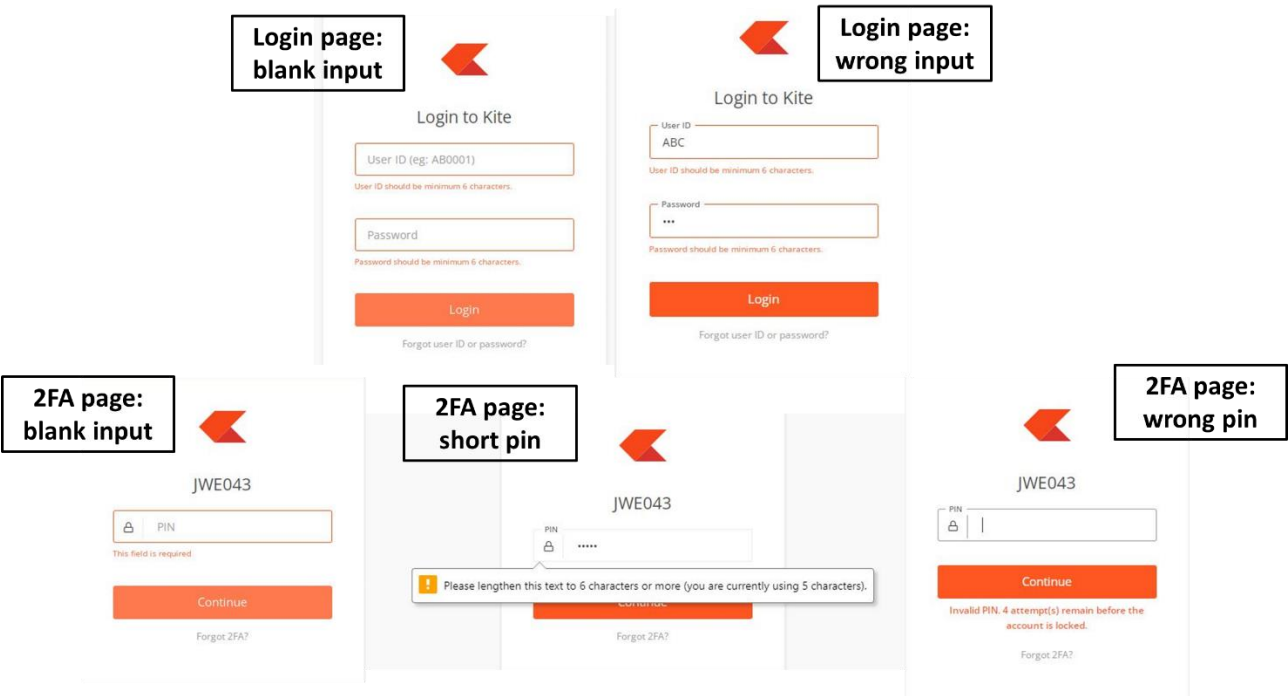

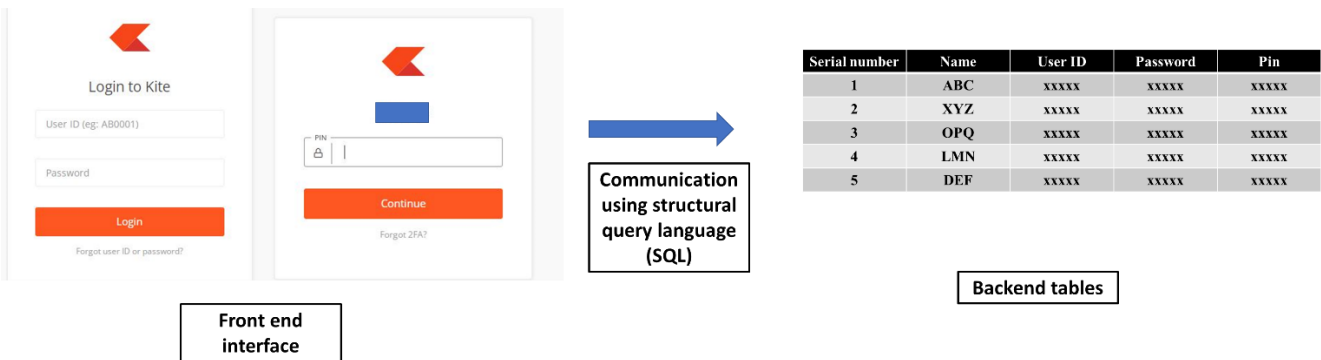

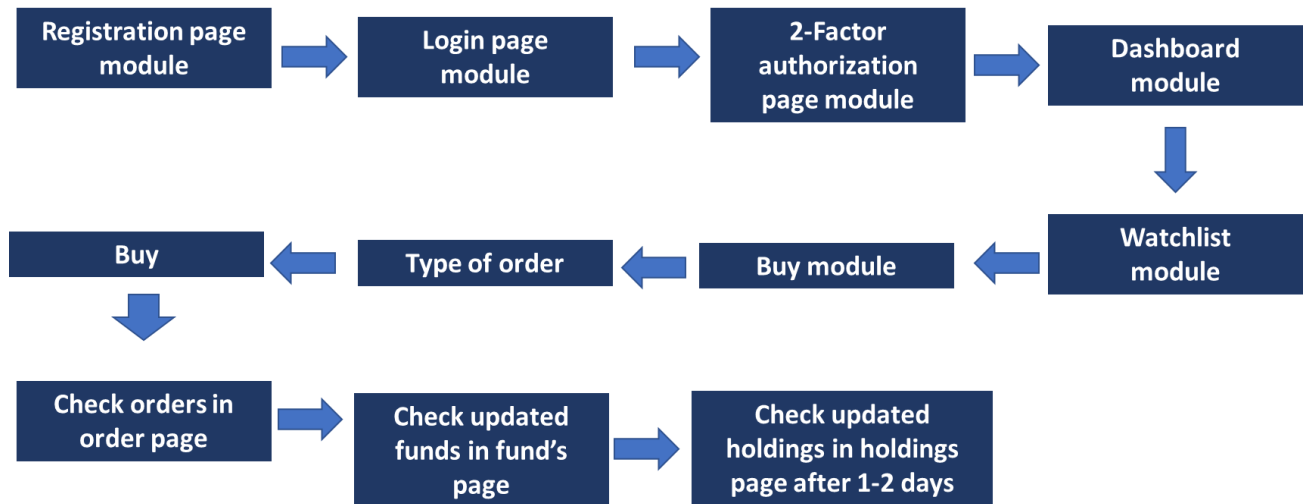

2)Error handling coverage: As a tester we are validating what are different types of error message are present in the objects when wrong data is entered. For example, in kite application:

3)Backend coverage: As a tester we are validating whether front end operations are stored in backend or not. The communication between front and back end will be done through SQL. For example, in kite application:

- 4) **Service based coverage:** Validating the functional flow diagram (given by product owner) whether it is correct or not. For example: Flow diagram of kite application.

- 5) **Calculation based coverage:** As a tester we validate / check arithmetic operations. (i.e. addition, subtraction, multiplication, & division) For example: In kite application.

Profit and loss % calculation of any particular share involve multiplication, division

Symbol	Change %	Price
SETFNIF50	0.38 %	102.74
DMART	3.47 %	1163.00
UNITECH	0.00 %	6.00
RMC	1.56 %	48.80
RELIANCE	-0.30 %	924.70
