

WHAT IS AGILE

SOFTWARE DEVELOPMENT

Lets say you went to a Restaurant

After going through the Menu you made your decision and gave your order

Please give me
all these

The waiter gets your order to the kitchen where the chefs prepare all your food and send it to you once everything is done , **all at once**

You will get your entire order
when everything is done

But what if you want to change your
order in between or add something to it

But now I don't want soda,
instead I wish for orange juice

Few dishes are cold

Sorry sir, your initial
order didn't have that

This would be frustrating,
isn't it ?

This is true in Software
development process too

*Developing a Software may
take months or years*

And its hard to determine the entire features in this high demanding world

Initially

1 Year Later

I need an App that can
get youtuber's videos
and tweets in one place

Sure

Can you add a feature
to get instagram reels
and youtube shorts too

your app
is done

But what if things happend this way

You went to the Restaurant and gave your order

Instead of preparing and presenting in one go ,
you were provided first with Starters , followed by
the main course and finally dessert one by one

do you like
this sir ?

*Here is your
main course sir*

Along with

Focussing on Customer collaboration ,
Individuals , interactions and good food

And can I change my
dessert to ice cream

Can you make this
soup extra spicy

Sure sir , will make
those changes

Now the Restaurant is Agile

What does Agile actually mean ?

Taking agile in its true definition, being Agile is about being able to understand, adapt, and change quickly in an ever-evolving environment. This, in its simplest form, means **that there is no one way to do things.**

Agile is a **mindset** , that focusses on a **set of values and principles**

- Individuals and interactions *over processes and tools*
- Working Software *over comprehensive documentation*
- Customer collaboration *over contract negotiation*
- Responding to Changes *over following a plan*

And 12 principles to satisfy the customer with continuous delivery , changing requirements , working together with better communication

Scrum and Kanban are two of the frameworks that are considered to be Agile

Can I also have the option to not pay the bill ?
